

Customer Journey Map: Import Data Using Transform Maps (Spreadsheet)

Overview & Context

This document outlines the end-to-end user experience for technical stakeholders performing bulk data operations within an enterprise environment.

- **Scenario:** Importing legacy spreadsheet data (e.g., CSV/XLSX user/asset records) into ServiceNow / Enterprise System using Data Sources, Import Sets, and Transform Maps.
- **Research Basis:** Best practices for ServiceNow data integration, system administration workflows, and user feedback from data analysts and system admins.

1. Journey Stages Framework

Journey Stage	Objective	User Actions & Steps	T
1. Entice (Preparation & Setup)	Identify data import requirements and prepare raw spreadsheet files.	* Define target tables and fields. * Clean spreadsheet data (headers, formats, nulls). * Download data template.	* * A
2. Enter (Staging & Data Source Configuration)	Load raw spreadsheet into the staging table (Import Set).	* Navigate to System Import Sets. * Create new Data Source. * Upload spreadsheet file and test connection.	* m F

Journey Stage	Objective	User Actions & Steps	T
3. Engage (Transform Map Creation & Field Mapping)	Create Transform Map and map staging columns to target fields.	* Create new Transform Map. * Define Target Table. * Run 'Auto Map Matching Fields' or manually map fields. * Set Coalesce fields (unique identifiers).	* F S
4. Exit (Transform Execution & Validation)	Run transformation and import data into target table.	* Execute Transform. * Monitor Import Log and Progress bar. * Validate inserted/updated records in target table.	* P *
5. Extend (Post-Import Maintenance & Automation)	Review logs, handle errors, and schedule recurring imports.	* Check error logs for failed rows. * Correct data and re-run transform for failed items. * Schedule automated recurring import jobs.	* S E

2. Key Takeaways & Recommendations

To ensure a seamless data migration and minimize system overhead, the following best practices should be implemented by the Person:

- **Always set Coalesce fields:** Prevents duplicate records by matching unique identifiers (e.g., Email, Sys ID, Serial Number) during import.
- **Pre-clean Spreadsheet Data:** Cleaning date formats, choice fields, and mandatory values before upload prevents script errors during transformation.

- **Use Transform Scripts for Complex Logic:** Implement OnBefore or OnAfter scripts for field transformations that require dynamic lookups or custom business logic.
- **Review Transformation Logs:** Always verify the "Error" and "Ignored" counts in the Import Set Row table before confirming the project as complete on Date.
